

Review

Open source software's and their impact on library and information centre: An overview

T. Raghunadha Reddy* and K. Kumar

Sri Venkateswara College of Engineering and Technology (SV CET), Chittoor, Andhra Pradesh, India.

Accepted 12 April, 2013

In this era of transition from information age to knowledge society, the libraries have much greater challenges to face. The whole insight of library has now changed from collection of books to a single window knowledge bank. This paper discusses the definition and features of open source library management software, criteria of selection of best open source library management software, their advantages and limitations. Open source library management software is a solution to reducing that cost. The paper describes in brief about the feature of some of the open source library management software like Greenstone Digital Library, DSpace, KOHA, E-Prints, NewGenlib, PhpMyLibrary, OpenBiblio, Avanti, etc., which are useful for developing digital library and institutional repositories.

Key words: Greenstone, DSpace, KOHA, E-Prints software.

INTRODUCTION

In the present era digitalized databases are being compiled in majority of the library services, which are based on information technology as well as resources available in electronic formats. In order to manage all kinds of resources and information, libraries require high quality integrated software, along with cutting edge retrieval tools. However, the high price of such software prevents most of the libraries from using them. So as to deal with this issue, and for the benefit of research scholars and the user communities of libraries, different NGOs, organizations and individuals have developed software, which are distributed free of cost. Known as free/open source software, these are extensively available on the internet and can be downloaded, installed and distributed.

Definitions

“Open source promotes software reliability and quality by supporting independent peer review and rapid evolution

of source code (Kamble, 2012). To be certified as open source, the license of a program must guarantee the right to read, redistribute, modify, and use it freely” (Rich Christie, 1999).

“Open Source Software is computer software whose source code is available under a license (or arrangement such as the public domain) that permits users to use, change, and improve the software, and to redistribute it in modified or unmodified form (www.richchristiecomputer.com), It is often developed in a public, collaborative manner. It is the most prominent example of open source development and often compared to user generated content” (Wikipedia).

Limitations with OSS

Open source software (OSS) is computer software whose source code is available under a license for users to look at and modify freely and permits users study, change, and improve the software, and to redistribute it in

*Corresponding author. E-mail: raghuthima@gmail.com.

modified or unmodified form (http://en.wikipedia.org/wiki/open_source_Software). The OSS differs from the closed source or proprietary software. The primary difference between the two is the freedom to modify the software.

For any up gradation/change in the OSS, the library needs support. In case of OSS, there is no body to solve problem, either one have to hire some expert to solve problem or library should make arrangement with some company. Open source products require technical expertise to operate and maintain open source costs more to support because the software is typically self supporting. Generally, a commercial software company will immediately respond on customer requests for any problem. With OSS, if one does not do it himself, he is at the mercy of a disjoint community of developers.

Selection of library management software

Selection of library management software (LMS) is not a simple task. Sometimes librarians go with either renowned software or maximum number of usage of the library. Selection of LMS may consist the following points/steps, which might help the librarians (Kumar, 2010) to select the right software for their house-keeping operations as well as information retrieval. There are many LMS, which are very popular and being used by number of libraries. Librarians may have the comprehensive study about them before taking decision in this regard. While examining the software, librarian must have the followings information about the software which might help them to select the right software for housekeeping operations as well as information retrieval.

- How it matches the library's requirements
- Product quality
- Features and functions
- Staff training and support service
- Operating system
- Hardware and software requirements
- Functionality: What modules are available, values additions to existing functions
- User interface: Navigation, error alerts, intuitive, customization
- Design: Flexibility, switching from one module to another, multifunction modules, does it enhance the productivity
- Conforming to standards: MARC, Z39.50, ISO-2709, etc.
- Scalability: Single user-multi use network. Can it be used in client server LAN architecture or fully web browsing architecture
- User-controlled customization
- Reports that help take decisions
- Security levels
- Migration of data or data transfer

Reasons for the success of open source software's

Openness

The generally open conducted development corresponds to the academic tradition to directly exchange results of (scientific) work, provide research data etc. So far, that "rule" attaches itself to the experiences of many people uses established communication channels and co-operation methods (Figure 1).

Flexibility

Many OSS projects integrate a large number of developers with very different emphasis and background. This facilitates the understanding for special requirements and, at the same time, offers the potential to quickly implement needed adjustments.

Speed

The speed by which there is reaction to problems, errors or security leaks of the software is legendary. A large group of people that want to make a product successful immediately undertake the tasks and test new versions, is significantly faster and more successful than the proprietary competitors.

Motivation

OSS developers are (experience themselves) part of a community that works on a collaborative success (-product). Often they are, by the way, no part-time hobby developers but professional developers that create OSS full-time. Also, the standard for governmental financed projects to provide the resulting software cost-free for others (that does not necessarily mean OSS or free software), supports the motivation.

Open source software in the field of library and information management

In comparison to other sectors, the emergence of 'Free/Open Source Software' in the field of library and information management are more viable option as the cooperation and coordination are the key issues in library services. Library professionals have always focused on cooperation, resource sharing, consortia and on open access, standards, archive initiatives; and so on in order to help each other in collection development and implementation of tools and technologies, among others. This attitude and the prevalent economic situations have facilitated the development of Free/Open Source

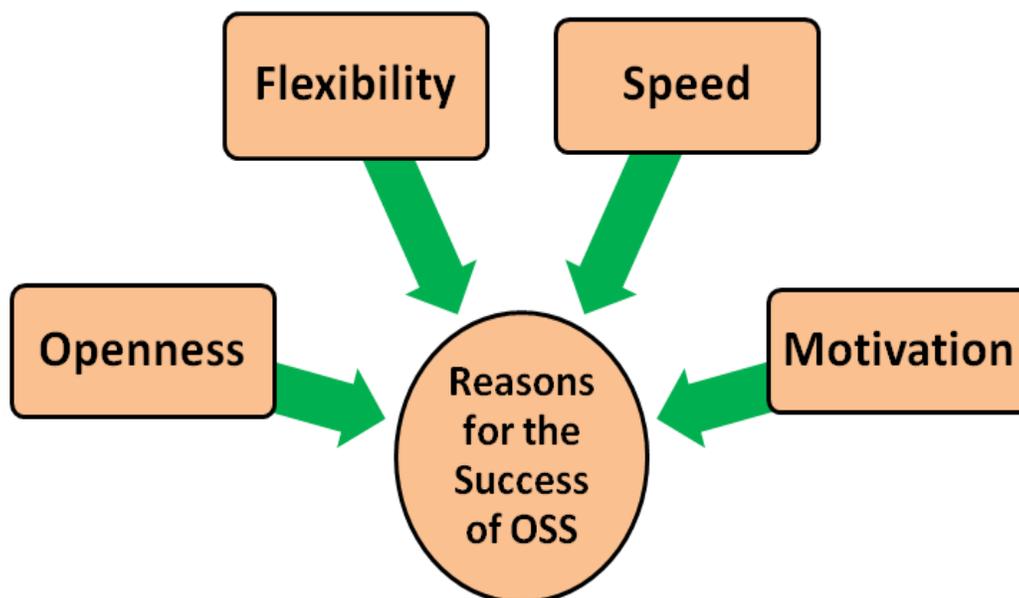

Figure 1. Reasons for the success of open source software's.

Software (Seeran, 2011) in the field of library and information management. In the initial stage, due to lack of awareness on technical aspects, right of use, sustainability, and so on, there has been a lot of confusion among librarians about 'Free/Open Source Software'. For instance, several arguments have been put forward that free software, by its very nature, is not well supported, and can only be installed and made ready to use by computer experts. This misconception prevents non-computer professional librarian to utilize this type of software, who prefer the easy to use commercial software that have user-friendly interface.

Selected open source software's

Major software's developed and available are described briefly along with their special features and uses (Figure 2).

KOHA

KOHA has the distinction of being the first open source integrated library management system, which includes all the main functions related to library management. It is web-based open source software distributed under the general public license. Koha supports windows as well as Linux platform. The first version of it was released in year 2000. The 'KOHA Development Team' offers to host the website for KOHA library system on its server. KOHA also has the capacity to manage digital libraries and online and offline electronic resources.

Features

KOHA is web-based Integrated Library Management System (ILS), with a SQL database (My SQL preferred) backend with cataloguing data stored in MARC and accessible via Z39.50. The user interface is very configurable and adaptable and has been translated into many languages. Koha has most of the features that would be expected in an ILS, including:

- Simple, clear interface for librarians and members (patrons)
- Various Web 2.0 facilities like tagging and RSS feeds
- Union catalog facility
- Customizable search
- Circulation and borrower management
- Full acquisitions system including budgets and pricing information (including supplier and currency conversion)
- Simple acquisitions system for the smaller library
- Ability to cope with any number of branches, patron categories, item categories, currencies and other data
- Serials system for magazines or newspapers
- Reading lists for members
- Easy barcode printing etc.

ABCD

ABCD represents the "Automation of libraries and Centres of Documentation". The name itself expresses the ambition of the software suite to provide not only automation functions for traditional libraries but also other information providers such as documentation centers. It

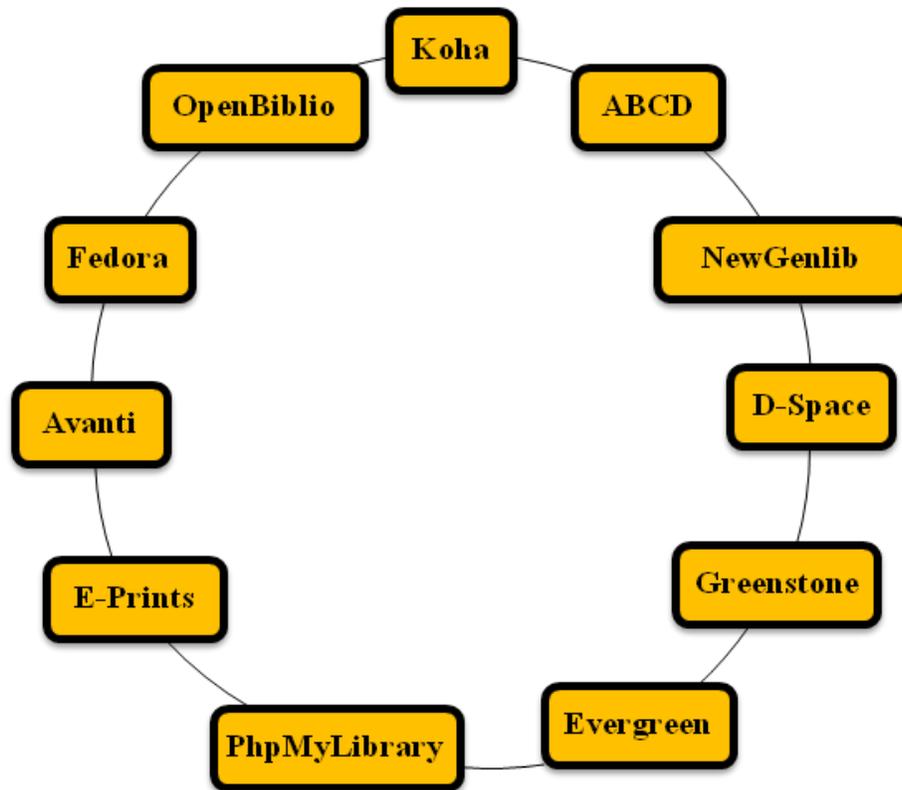

Figure 2. Some of open source software's.

has been developed by BIREME (WHO, Brazil) in collaboration with the Flemish Interuniversity Council, Belgium, and using UNESCO's ISIS database technology. This software provides flexibility and versatility (Dhamdhere, 2011). The bibliographic structures, including all types of digital resources, can be managed by this software and created along with non-bibliographic structures (Dhamdhere, 2011). The first version of ABCD (v1.0) was released on 5th December, 2009. ABCD has been built up with technologies such as ISIS database, ISIS formatting language, CISIS, ISIS Script, ISIS NBP, Java Script, Groovy and Jetty, PHP, My SQL, Apache, and YAZ.

Features

- The software is fully web-based, so can be used and managed from any current web-browser
- All main functions of the library management are integrated using the same interface and databases
- Bibliographic records can be imported from external library catalogs/servers through Z39.50 facilities
- Full MARC 21 compatibility with fields, indicators, and subfields defined by Library of Congress
- OPAC with simple Google-like search as well as advanced search with Boolean operators, truncation, and

field-limitation for all kinds of databases, locally created or external

- Access to both physical and electronic documents (local or on the internet) with the same interface
- Library staff can define copy or edit any new database structure with existing ISIS-applications such as MARC, CEPAL, UNIMARC, and Dublin Core
- Available in many languages like English, French, Spanish, Portuguese while more language versions are on the way
- Contents and bibliographic resources, both local and external, can be added easily without HTML-programming.
- Excellent serials management with a fully implementation of the ISSN standard and union catalog function.
- Statistical report generation with graphical presentation of any defined set of variables in the databases.
- Freedom of database structure

NewGenlib

NewGenLib (New Generation Library) is an integrated library management system developed by Versus Solutions Pvt. Ltd. Domain expertise is provided by Kesavan Institute of Information and Knowledge Management

(KIIKM) in Hyderabad, India. NewGenlib version 1.0 was released in March 2005. On 9 January 2008, NewGenlib was declared Open Source Software under GNU General Public License (GPL) License by Versus Solutions. Currently NewGenlib 3.0.3 U2 is the latest version running. Presently about 2,500 libraries and information centres are using NewGenlib across the world.

Features

- Functional modules are completely web based. Uses Java Web Start™ Technology
- Compatibility - Complies with international metadata and interoperability standards: MARC-21, MARC-XML, z39.50, SRU/W, OAI-PMH
- Scalable, manageable and efficient
- OS independent - Windows and Linux flavors available
- Unicode 4.0 compliant
- Easily extensible to support other languages
- Data entry, storage, retrieval in any (Unicode 3.0) language
- Networking – Hierarchical and Distributed networks
- Automated email/instant messaging integrated into different functions of the software
- Form letters are configurable and use XML-based Open Office templates
- Supports multi-user and multiple security levels
- Allows digital attachments to metadata

D-Space

D-Space is an open source software package that provides the tools for management of digital assets, and is commonly used as the basis for an institutional repository. It supports a wide variety of data, including books, theses, and 3D digital scans of objects, photographs, film, video, research data sets and other forms of content. The data is arranged as community collections of items, which bundle bit streams together. D-Space is also intended as a platform for digital preservation activities. D-Space was released by HP-MIT Alliance in 2002 and since its release is very popular open source software. It has been installed and successfully working extensively and widely in universities, higher education colleges, cultural organizations, and research centers etc. It is shared under a Berkeley Software Distribution license, which enables users to customize or extend the software as needed.

Features

- D-Space is written in Java
- It uses a relational database, and supports the use of Postgre SQL and Oracle

- It currently support two primary web interfaces-a classic one (JSPUI) which uses JSP and the Java Servlet API, and a newer interface (XMLUI) based on Apache Cocoon and using XML and XSLT technologies
- D-Space holdings are made available primarily via a web interface, but it also supports the OAI-PMH v2.0, and is capable of exporting METS (Metadata Encoding and Transmission Standard) packages
- Future versions are likely to see increasing use of web services, and changes to the user interface layer
- The system is organized into communities, sub-communities, and collections
- Supported all type of digital formats, including books, theses, datasets, computer programmes, bibliographic datasets, Images, audio files, video files, learning objects web pages and so on
- Access control over items in repository at collection and individual item levels
- Allows easy migration of items in the system across newer versions
- Able to interoperate other systems in the organizations
- Allows customization of subsystems as per requirement
- D-Space can be used for self archiving by institutions and faculties. It provides long-term physical storage and management of digital items in a repository

Greenstone

The Greenstone Digital Library Software (GSDL) is a top of the line and internationally renowned 'Open Source Software' system for developing digital libraries, promoted by the New Zealand Digital Library project research group at the University of Waikato and is sponsored by the UNESCO (<http://www.unesco.org>). The software is issued under the terms of GNU General Public License. Greenstone provides a way of building, maintaining and distributing digital library collections, opening up new possibilities for organizing information and making it available over the Internet or on CD-ROM.

Features

- Greenstone builds collections using almost popular and standard digital formats such as HTML, XML, Word, Post Script, PDF, RTF, and many other formats which include audio as well as video
- It is provided with effective full-text searching and metadata-based browsing facilities that are attractive and easy to use
- It runs on a wide variety of platforms such as Windows, Unix/Linux, Apple Mac etc. and provides full-text mirroring, indexing, searching, browsing and metadata extraction
- UNICODE based multi-lingual capabilities and a user-friendly multimedia interfacing

- Customization of various features fulfilling specific user requirements
- Browser based access
- Use of Dublin Core and other metadata scheme
- Use of plug-in for converting the file format into standard XML-based internal format for indexing purposes
- Administrative features that support access control and user activity logs
- Different interfaces for user choice for collection-building like command mode, web, and Java-based GUI interface
- Multilingual interface available in English, Arabic, Chinese, Dutch, French, German, Maori, Portuguese, and Spanish etc.
- Z39.50 client available on Linux systems

Evergreen

Evergreen is an open source Integrated Library System (ILS), initially developed by the Georgia Public Library Service (2006), Public Information Network for Electronic Services (PINES) and the Evergreen Community. It is distributed under the GNU General Public License. Evergreen has been written primarily in Perl and PostgreSQL, with a few optimized sections (Singh, 2007) rewritten in C. The catalog interface is primarily JavaScript with XHTML, and the staff client user interface is written in Mozilla's XUL (XML + JavaScript). The user interface for most new staff client functionality is being built with the Dojo Toolkit JavaScript framework. Python is used for the internationalization built infrastructure. EDI functionality for the acquisitions system depends upon Ruby support.

Features

- Search/Retrieve via URL and Z39.50 servers
- Flexible, powerful reporting for retrieval of any statistical information stored in the database.
- Online Public Access Catalogue (OPAC)
- Customization of various features fulfilling specific user requirement.

PhpMyLibrary

PhpMyLibrary is a PHP/My SQL web-based library automation application meant for smaller libraries. The software has the facilities of cataloguing, circulation, and OPAC module. The software also has an import export feature. It strictly follows the USMARC standard for adding materials. This software is compatible with the content management system and has as facility of online reservation system for library and also supports import from ISIS database with an ISIS2MARC program.

OpenBiblio

OpenBiblio is an easy to use, open source, automated library software written in PHP. This software has facilities of OPAC, circulation, cataloging, and other administrative work. OpenBiblio is well documented, easy to install with minimal expertise and designed with common library feature.

Avanti

Avanti Micro LCS Software is developed by Avanti Library Systems in Java language. This is a small, simple, and easy to install and use open source software. It is a platform independent, and can run on any system that supports a Java runtime environment. This software is useful for small libraries; it has a powerful and very flexible architecture that allows it to be adapted for use in libraries of any type. This software incorporates standards such as MARC and Z39.50 as modules and interfaces.

E-Prints

E-Prints has been developed at the University of Southampton School of Electronics and Computer Science in 2000 and released under a GPL license for building open access repositories that are compliant with the Open Archives Initiative Protocol for Metadata Harvesting (OAI-PMH). It shares many of the features commonly seen in document management systems, but is primarily used for institutional repositories and scientific journals.

Fedora

Fedora software gives organizations a flexible service oriented architecture for managing and delivering their digital content. Digital objects exist within a repository architecture that supports a variety of management functions. All functions of Fedora, both at the object and repository level, are exposed as web services. These functions can be protected with fine-grained access control policies. This unique combination of features makes Fedora an attractive solution in a variety of domains. Some examples of applications that are built upon Fedora include library collections management, multimedia authoring systems, archival repositories, institutional repositories, and digital libraries for education.

CONCLUSION

Libraries with small budgets always consider automation

of housekeeping operations as a financial burden due to the high cost of commercial software. However, development of Open Source Software is an effective way to automate library operations without undertaking substantial financial investment. Libraries are taking up Open Source Software as a way to reduce the costs of expensive commercial products and as a viable alternative to the often expensive proprietary library automation systems. "The benefits of Open Source Software can potentially reduce costs; give users more control and increase software performance" (Courant and Griffiths, 2006). Librarians need to understand open source license for promotion the use of Open Source Software. This is the only way to face the challenges posed by commercial software in the market. It will also increase the autonomy and control of the professional over software solutions. In conclusion, the advent of open source library software has ushered in a revolution in the field of library and information resources management, and has become popular choice for most library and information professionals because of their numerous benefits and useful features.
