---

The paper presents the results of applying the developed models for measuring process key performance indicators (KPIs) in a complex industrial company, including analysis of the effectiveness of its implementation in the analyzed field. The aim of this study was to demonstrate that the general approach and principles of organization and management of an industrial enterprise - based on the integration of its functions are universally valid and that it is possible to establish a standardized system of criteria - parameters (performances) of the process, which in required and sufficient measure reflect the effectiveness of the overall success of the industrial enterprise. On this basis a model of measuring KPIs in the industrial enterprises is developed or the system of parameters of process quality in industrial enterprises which have obtained the conditions for the development of management models for their supervision (monitoring) by the management. Research results indicate that the application of a particular model for the measurement of KPIs in the industrial enterprise led to a higher level of effectiveness of the industrial enterprise as a whole.

**Key words:** Industrial company, process improvement, key performance indicators (KPIs).

---

## **INTRODUCTION**

In conditions of rapid change in the market the company can survive and achieve its long-term goals only by timely definition of good strategy and its successful application. In these circumstances the company may have great help in knowing and applying certain methods of management that are used for measuring business results.

Industrial company that nowadays wants to succeed in a turbulent and complex business environment has to adopt such a business policy that will create an organization capable of simultaneously doing three important things - to improve, to expand and innovate (Drucker, 2005).

Industrial enterprises must, above all, consistently

apply process approach (ISO 9001:2008) in order to achieve significant improvements. Process approach allows a perception of buyers' demands, and the responses to these requests seek ways how to reach the planned results of management.

Process improvements are a regular topic of different management "debates". Although the majority of industrial enterprises established a system of quality management and thereby committed themselves to application of improving tools, the practice of starting and unmanaging projects of improving is still accessed in an unsystematic way.

Most contemporary studies related to engineering management are focused on the implementation of

existing and developing new models that will achieve business excellence. Control of the strategic goals is done through inter-organizational measurements and their comparison with historical data from the company database (List et al., 2005).

According to this, the present-day researches deal with the problems of establishing a program of measuring processes in the company. This refers to the process of establishing a measurement process, establishing a database, selecting the appropriate optimal cluster of indicators, extracting the data on measuring sizes, and application of various statistical models of data analysis for improving performance.

Previous research related to recent performance measurement models is based on partial performance measurement whose concept did not give a good insight into the basic factors of achieved business results, not even understanding which aspects of the business should be improved and how to impact on key performance of the company in the future.

Various researchers have been trying to determine a set of quantitative measures to be used for advanced control of software product development processes that involves initiating and controlling the implementation of improvement programs. Thus, for example Wang et al. (2006) proposed an optimal set of measures developed by the case studies from industry.

Abran et al. (2004) gives an example of the functioning of modern methods for measuring the impact of industrial companies with suggestion for efficient and effective process management and quality, in order to achieve business excellence. Management based on quantitative data is one of the conditions for a higher level of maturity in the organization, so the aforementioned model of quality management based on the *International Standards Organization* (ISO) emphasizes the importance of measurement and quantitative process control in industrial enterprises. One of the evidences of the importance of quantitative measurements, such as developing software applications, is the fact that the *Software Engineering Body of Knowledge, SWEBOK* (a standard reference for software engineering), plans to introduce a special area of knowledge devoted exclusively to measurements.

Continuous supervision over the execution of the set of plans is a prerequisite for supervisor's influence on processes control and the elements on which depend their implementation, as well as the responsibility due to their defaults. It is especially important to emphasize that the aim is setting up the planned sizes in variations, so that the participants in the planning process have the choice of those variants that they find as the most acceptable (Schmitz and Platts, 2004; Lin and Yahalom, 2009; Rodriguez et al., 2009).

Generating, processing, and analyzing business data in industrial enterprises is realized with the aim to provide a basis for management decision-making at all levels of

management.

Improvement can be successful when based on facts derived from the analysis of the causes of unsatisfactory conditions. This includes different measurements in processes. Improvement of any process cannot be achieved without constant measurement of the process results. It is important to measure the current process results, set goals so as to be measurable, test improvements, standardize the upgraded processes, measure the results of the new process and set new goals. Measuring encourages continuous improvement and continuous improvement encourages and motivates employees. In these processes the application of statistical methods and tools in the process of planning, collecting and analyzing measuring data has no alternative.

In order to develop a model of key performance of complex industrial enterprise, it is necessary to make a connection between the Balanced Scorecard - BSC concept (Kaplan and Norton, 1999, 2001), then the process model of performance measurement (ISO 9001: 2008) and key performance indicators – KPIs.

Model for the measurement of key performance indicators in industrial enterprise was developed as part of establishing quality management system (Đurić et al., 2010).

Garengo (2009) aims to contribute to understanding of performance measurement systems (PMSs) in small and medium enterprises. The paper proposes a framework to classify PMSs and shows how it can be used to study the PMSs adopted by a group of leading Italian SMEs.

Skibniewski and Ghosh (2009) addresses a key question related to enterprise resource planning (ERP) systems applications in the engineering construction industry - what are the areas of business processes within the engineering construction industry where ERP cannot be used to collect key performance indicators related to business processes. The paper Gongbo et al. (2011) aims to identify the KPIs for measuring the performance of value management studies in construction. Likewise, Radujkovic et al., (2010) elaborated role and types of key performance indicators in the construction industry and shown how different management perspectives perceive the indicators.

The basic starting point in developing a model for measuring key performance indicators of industrial enterprises was the criteria of performance, in accordance with the concept of Balanced Scorecard (Kaplan and Norton, 1999, 2001), which are derived from the vision and strategy of the company, which is essentially a balanced model of enterprise management and target performance and their criteria, and which is again based on the financial and nonfinancial "perspectives".

The second segment of the model is a "process model" according to ISO 9001:2008, which requires measurement of performances from specific angles.

**Table 1.** Processes in a given complex company.

- 
- Process of planning and analysis (110)
  - Process of human resource management (120)
  - Process of business legal regulation (130)
  - Process of quality management (200)
  - Process of marketing (310)
  - Process of sales (320)
  - Process of supply (330)
  - Process of finance and accounting (340)
  - Process of product and service development (410)
  - Process of applying IT (420)
  - Process of production of bauxite (510)
  - Process of production of non-metals (520)
  - Process of production of construction materials (530)
  - Process of machine production (540)
  - Process of processing of agricultural products (550)
  - Process of freight traffic (610)
  - Process of long-distance traffic (620)
  - Process of passenger traffic (630)
  - Process of construction services (640)
  - Process of catering services (650)
  - Process of storing (710)
  - Process of maintenance (720)
  - Process of managing measuring equipment (730)
  - Process of employees safety (740)
  - Process of securing buildings and property (750)
- 

The third segment of the model is establishing a system of key performance indicators that represents the quantitative and qualitative indicators, and is used for measuring, monitoring and managing business results of enterprises and providing the comprehensiveness of the management process. The indicators enable comparison of actual performance size to target sizes of the previous measurement period, i.e. established standards, and the performance of competing companies.

In the next part of this work an example of the model for the organization and management of industrial enterprises is shown, in which the integration of its functions is emphasized, thus allowing the management structure of enterprise continuous monitoring of key parameters of results as well as their decision-making for continuous improvement and development.

In the specific example of a complex industrial enterprise it is shown that a number of defined areas of work – functions of the company which in harmonic, integrative effect enable the implementation of all necessary processes.

The model is adapted to complex industrial company through the elaboration of the concept of Balanced Scorecard (BSC) and identification of key performance

indicators (KPIs) in the financial perspective, a perspective of buyer / customer, internal process perspective and the perspective of learning and development.

Thus defined model of key performance of complex industrial enterprise provides an independent view of each process and defines key performance indicators for all processes.

#### **APPLICATION OF DEVELOPED KEY PERFORMANCE MODEL IN AN INDUSTRIAL COMPANY**

Model for the measurement of key performance indicators is applied on the real example of the complex industrial company with different areas of activity for period of one year (Đurić et al., 2010).

Structure of the identified processes in the analyzed company is shown in Table 1 and Figure 1.

The structure of the identified processes and their interconnections is shown by the process model using an example of the complex industrial enterprise (Figure 1), which consists of the following groups of processes:

- i. Management processes
- ii. Realization processes
- iii. Support processes
- iv. Measuring and improvement processes.

In the above example of the complex industrial enterprise, each functional activity has its own specific work processes that are managed in a manner that ensures stable mutual linkages, whose goal is to work effectively within the whole.

#### **BALANCE SCORECARD IN A COMPLEX INDUSTRIAL ENTERPRISE**

Practical implementation of Balanced Scorecard concept, suggests the need to adjust to the nature and characteristics of the case (the area of business, size of company etc.), as shown in Figure 2 (Đurić et al., 2010).

In the practical implementation of applying of Balanced Scorecard concept it is necessary to identify key performance indicators for companies in all four areas of observation, with clearly outlined need that measurement in these areas of observation is standardized to a level that ensures the needs of company - without "burdening" with the concepts of financial, technical or nonfinancial.

In this industrial company a system of managing performance and goals is established, that is, a system for making, measuring and controlling the achieved goals.

Access to concretization of key performances of the process in case of joint-stock company (Figure 3), is based on experiences in the application of process approach according to ISO 9000 standards.

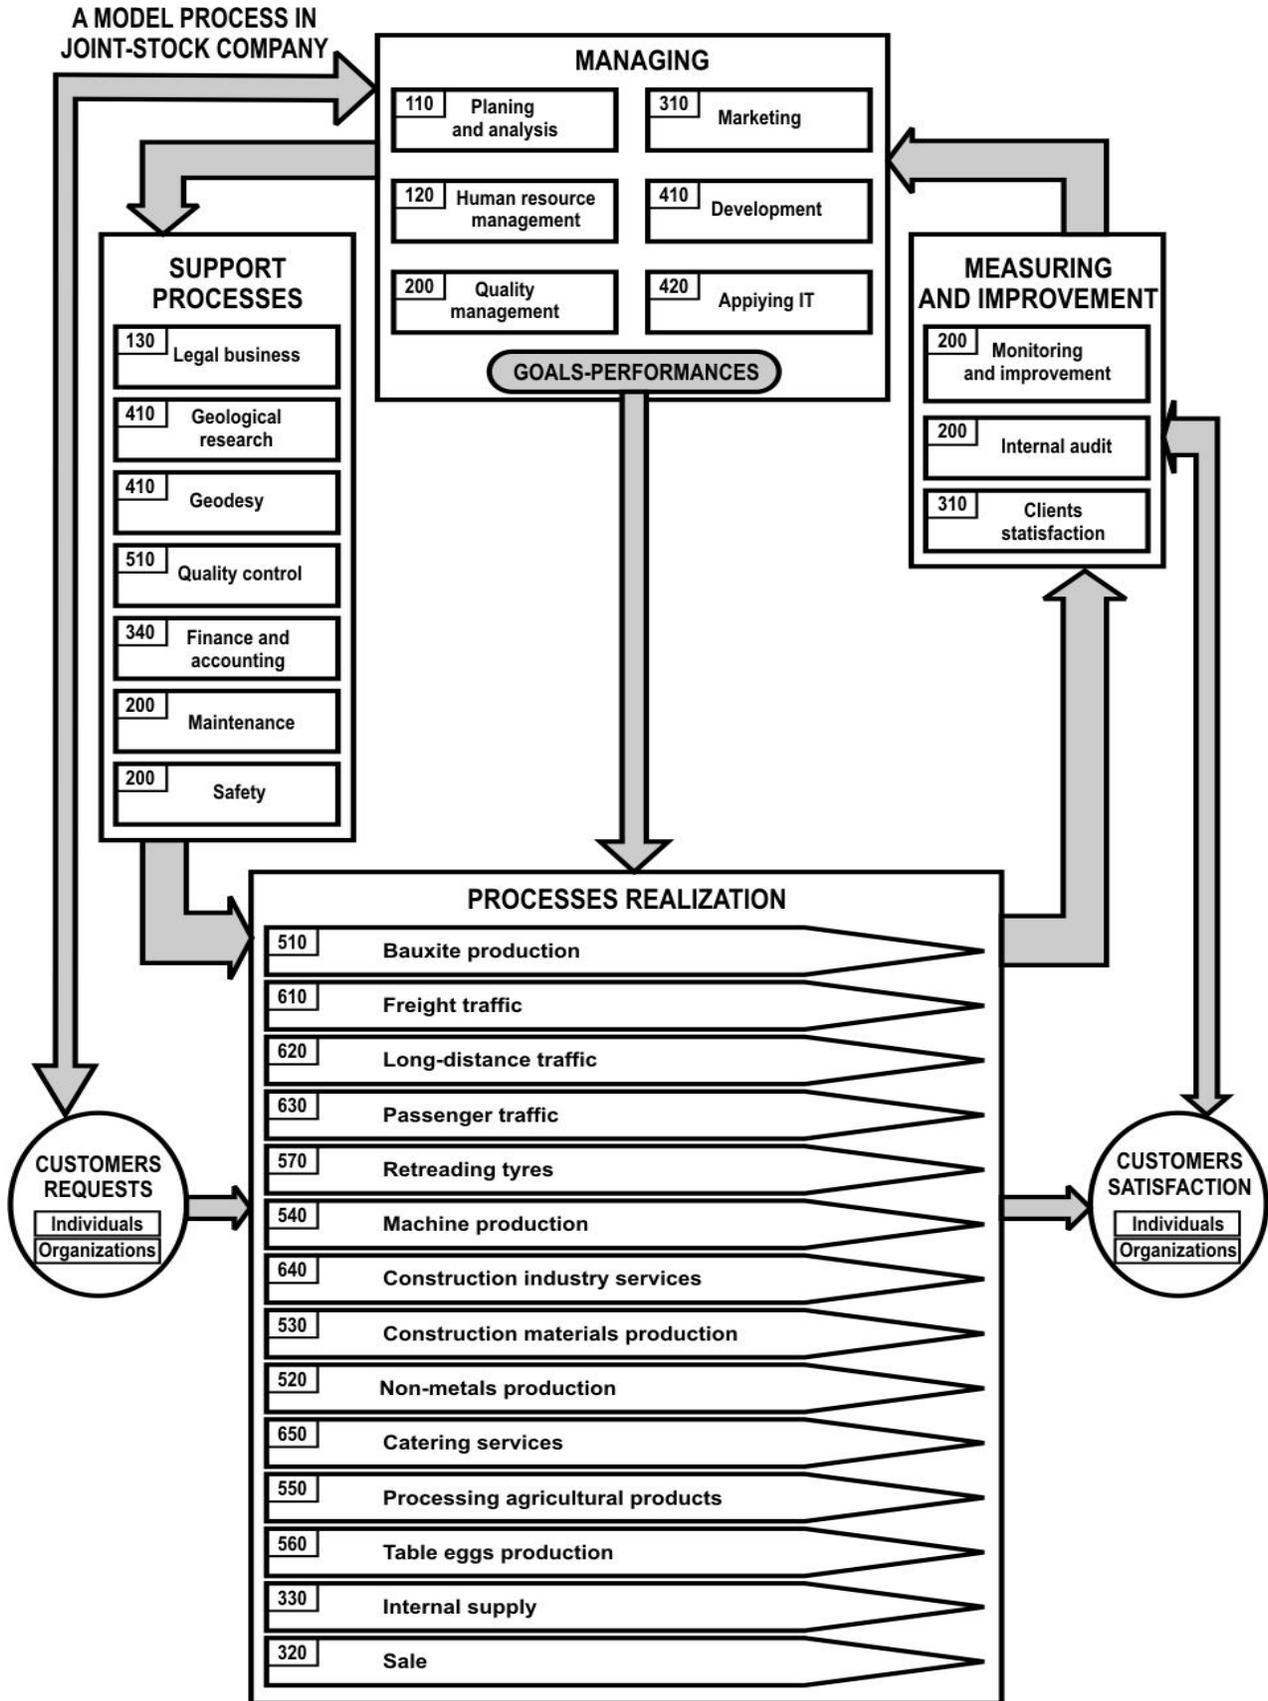

Figure 1. A process model in real complex enterprise (Đurić et al., 2010).

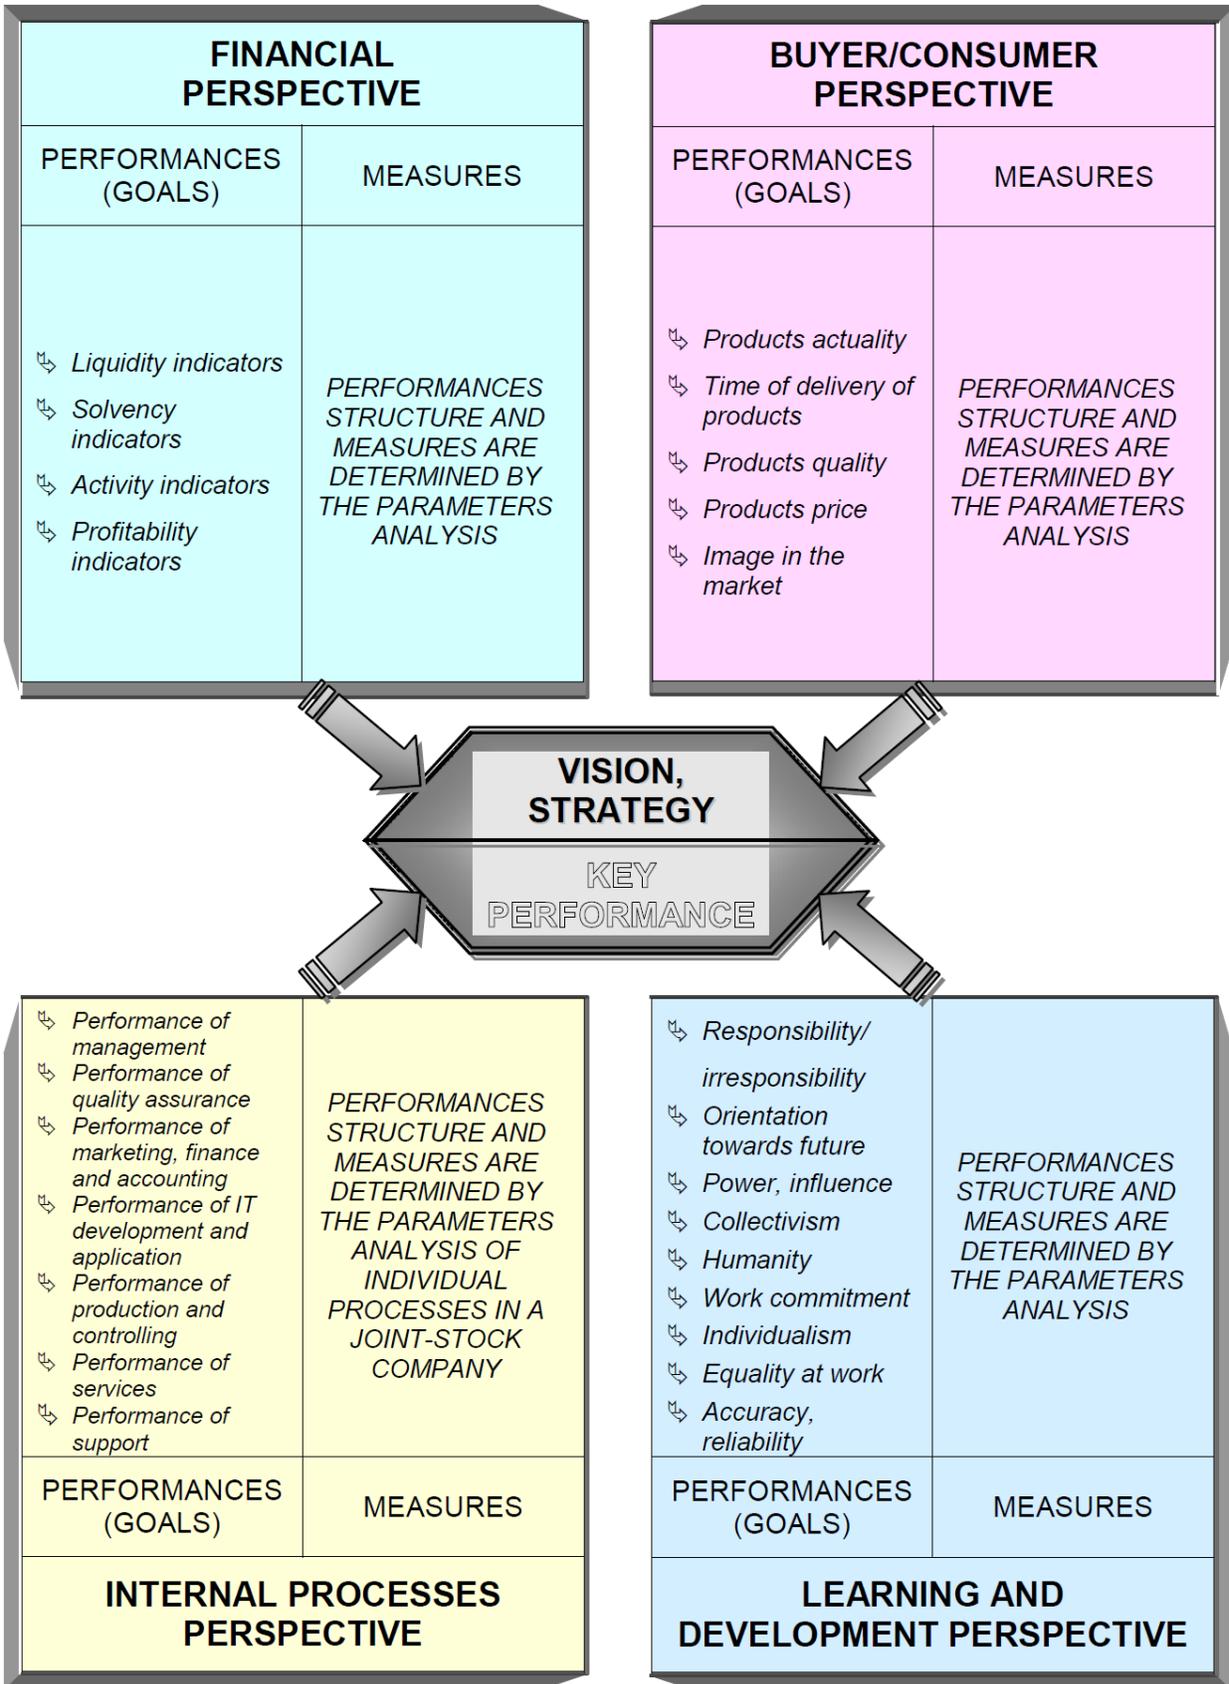

Figure 2. Development of the balanced scorecard concept – [Adapted from Kaplan and Norton (1999, 2001)].

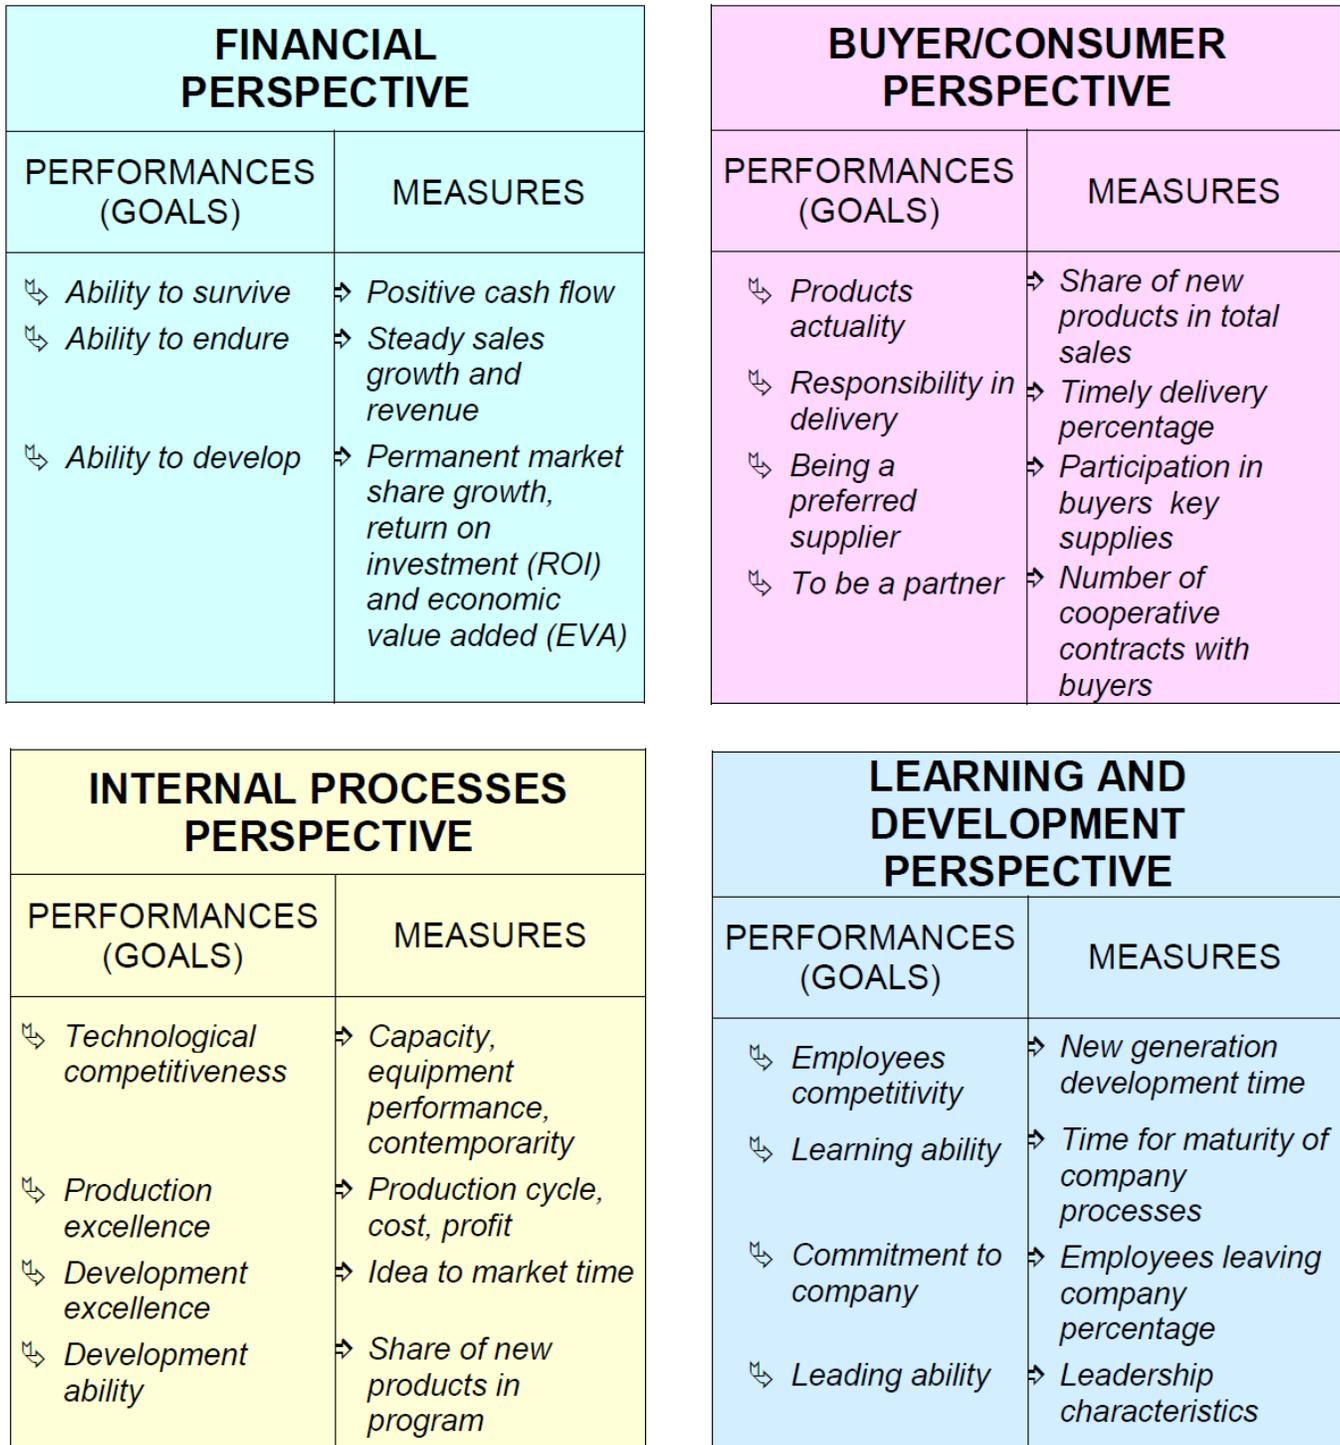

Figure 3. The balanced scorecard concept adapted to the joint-stock company (Djuric et al., 2010).

**KEY PERFORMANCE INDICATORS IN THE JOINT-STOCK COMPANY**

In this case, key performances of the joint-stock company

viewed from the perspective of internal processes, in terms of their structure and performance measures, are determined by the analysis of parameters of individual processes and *key performance indicators* that are used

**Table 2.** Map of key performances of process 110 - Planning and Analysis.

in this joint-stock company are presented.

Bearing in mind that the presented perspectives of processes and approach to concretization of key performances of process are adapted to the industrial enterprise, it should be emphasized that the model for the measurement of key performance indicators, is used for detailed definition of performances of internal processes.

In this sense, the *map of key performances of process* (Đurić et al., 2010) was used for conducting an analysis of the internal process by checking the developed model for the measurement of key performance indicators of the joint-stock company.

In continuation of this work the developed maps of key performances for specific processes will be

represented as shown in Tables 2 to 7 which are selected as samples.

It is about the following processes of the sample industrial enterprise as follows:

- i. process of planning and analysis (110);
- ii. process of sales (320);
- iii. process of supply (330);

**Table 3.** Map of key performance of process 320 – Sale.

**ANALYSIS OF RESULTS OF APPLICATION OF KEY PERFORMANCE MODEL**

Detailed check of applying an elaborated model of key performances of the sample company was carried out in accordance with the analysis of results of applying the model for measuring key performance indicators for a period of one year.

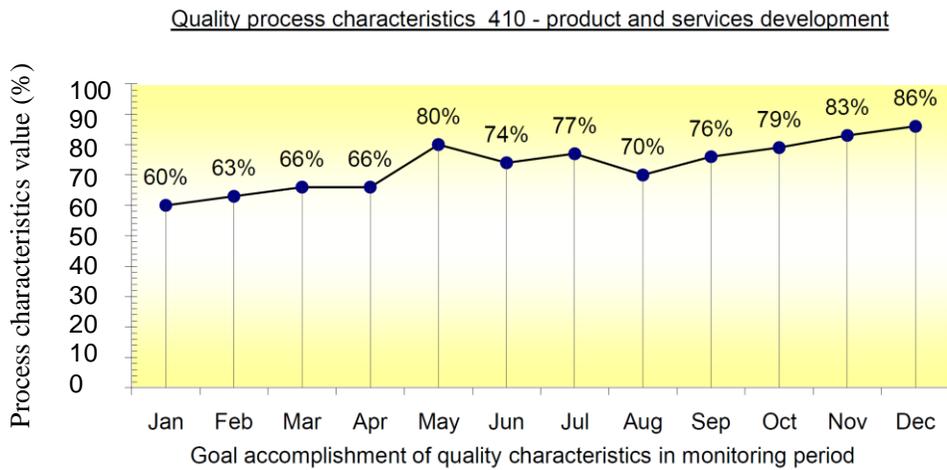

All the processes defined and presented in the charts in Figures 4 to 9 correspond to Tables 8 to 13 which are the analysis of the results of application of the developed model of key performances of process in the sample joint-stock company for the year 2009.

Review of the total goal accomplishment for individual processes in the sample industrial company is shown in Figure 10.

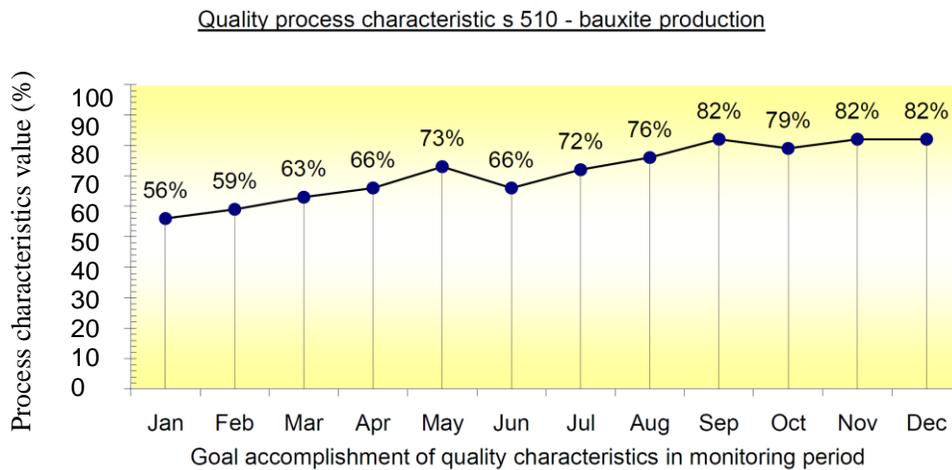

Analyses of the presented results of measuring the process goals in the sample industrial company indicate the state of performances of individual processes, and they are used as input for the process of reviewing the company effectiveness by the management, which

 $OC_p$  – Process goal accomplishment in the monitoring period ( $\Sigma BP_{kp}$ ) [%].

secures information for improving the performances of the company as a whole. Practically, the analysis of measurement the process goals allows the identification of "critical points" in each process based on lower assessment of the quality characteristic of key performance indicators of the process, and then it allows comparing to the planned and the performance of competing companies, so as to thereby identify areas for process improvement.

Analysis of the results contributed to establishing the root causes of existing or potential problems, and thus represents a source for initiating corrective and preventive measures.

All the characteristics of the process are measurable, thus providing transparency and particularity in data analysis.

Availability of information indicating the status of the process directly or indirectly, as already noted, is the requirement for taking action to improve process

performance.

## DISCUSSION

In order to successfully measure the operating efficiency of this complex industrial enterprise, and to raise the level of quality in the individual business processes, it was necessary that special attention is paid to the application of new approaches to management - in the conceptual and organizational sense. It was necessary to provide a tool with which the management of company, in a balanced way, reaches the level necessary to meet demands of all stakeholders.

The process of continuous extraction, processing and analysis of data is systematically performed, in order to obtain relevant information regarding the work process in the entire company.

A key result of the research is that application of the

model of key performance of complex industrial enterprise contributes to increasing level of process characteristics, and their joint effects, which can also be used for defining BSC for the complex industrial enterprise.

Establishing a system of consistent criteria - parameters (performance) of processes in the company, made it possible to increase the effectiveness of these processes and overall business success there. During the period in which the analysis was conducted, the basic parameters (performance) of the observed internal processes had sufficient size and positively oriented trend that is reflected in the need of applying a strategy of rapid development of new capacities of industrial enterprise and its global expansion. The obtained results of the analysis provide information on the need of applying more aggressive strategy for growth and development of the observed company.

## CONCLUSION

The survey, whose results are presented in this paper, represents a concrete contribution to the application of management methods intended for measuring the business success of complex industrial enterprise.

An important component of the developed model, which measures the success of the business by reaching the strategic goals, are the quality characteristics of processes and key performance indicators of process, which are again base for an industrial company to learn from the past experience and introduce changes for improving process performances in the future.

Starting from the findings that have been reached in this study, it is possible to draw conclusions that point to such a solution which should ensure a way of settling problems that occur in the system of establishing and managing key performance indicators used to measure,

Total goal accomplishment of quality process characteristics – 610 in 2009:										<b>70%</b>		

$V_{kp}$  – Process characteristics value;

$BP_{kp}$  – Number of process characteristics points (multiplication of process grade and ponder);

$OC_p$  – Process goal accomplishment in the monitoring period ( $\Sigma BP_{kp}$ ) [%].

**Figure 10.** Review of the goal of quality characteristic of the process in the sample industrial enterprise for 2009.

monitor and manage business performance in the industrial company, in other words, determining the actual level of interdependence between the achieved quality of individual processes and indicators of effectiveness of the entire business enterprise. Achieving the integrity of certain perspectives or areas of the model of key performance of the industrial enterprise processes makes it possible to get insight into the important indicators of actual business results of enterprise, and determine which business processes should be improved and how to impact on their future design.

The development of company key performance model in already established perspectives helped in identifying critical factors and criteria for monitoring the achievement of strategic goals and measuring of the business results or the efficiency of complex industrial enterprise in the monitoring period.

Also, research in the framework of this study has shown that it is possible to establish a standardized system of criteria - parameters (performance) of the process, which in required and sufficient measure reflect the process effectiveness and the overall success of

the industrial enterprise. A general model of key process performance is developed as a suitable tool for measuring and analysis of key performance indicators of work processes in industrial enterprise.
